

ToroDB

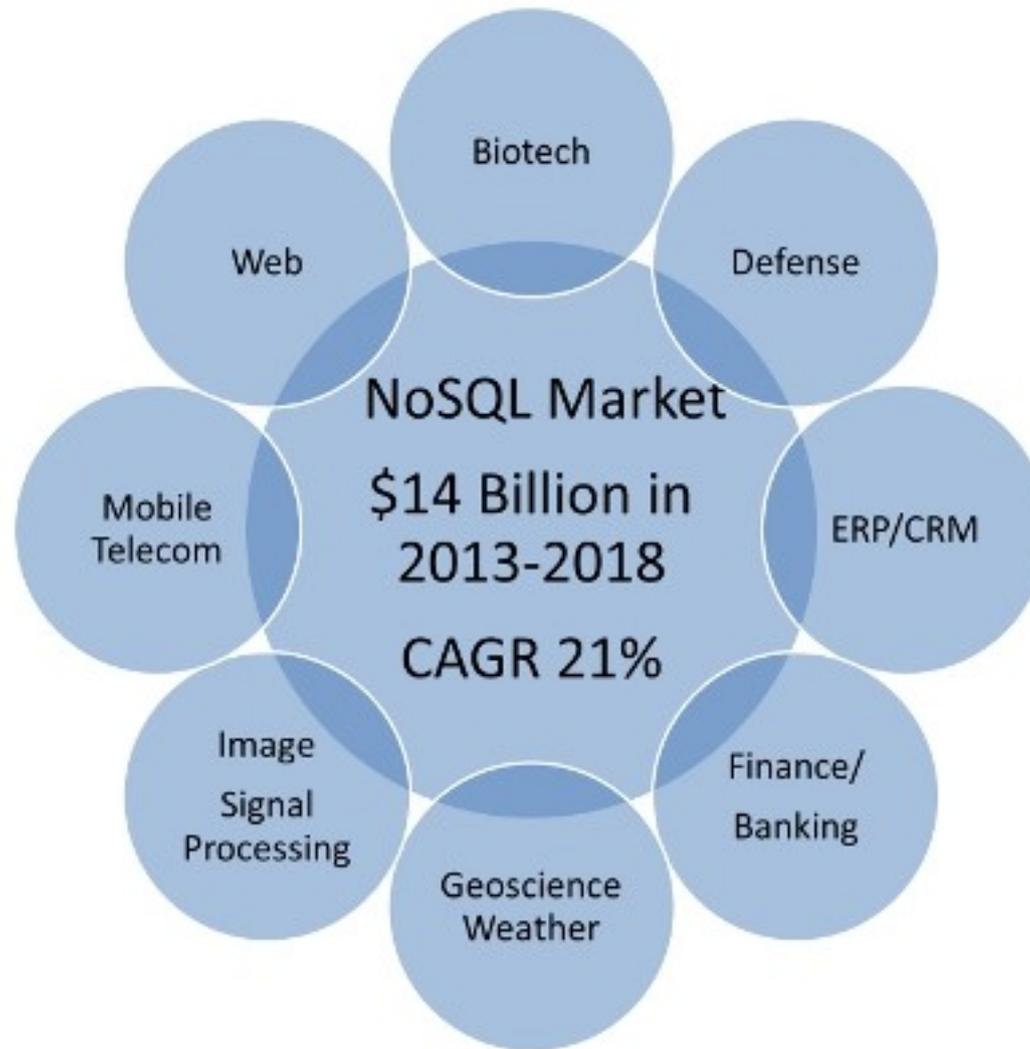

A new, open-source,
document-oriented, JSON database,
built on Postgres

How big is “NoSQL”?

Source: 451 Research

Why people want “NoSQL”?

- Schema-less
- High availability
- It's cool

The schema-less fallacy

```
{  
  "name": "Álvaro",  
  "surname": "Hernández",  
  "height": 200,  
  "hobbies": [  
    "PostgreSQL", "triathlon"  
  ]  
}
```

The schema-less fallacy

```
{  
  "name": "Álvaro",  
  "surname": "Hernández",  
  "height": 200,  
  "hobbies": [  
    "PostgreSQL", "triathlon"  
  ]  
}
```

metadata → Isn't that... **schema**?

The schema-less fallacy: BSON

```
{  
  "name": (string) "Álvaro",  
  "surname": (string) "Hernández",  
  "height": (number) 200,  
  "hobbies": {  
    "0": (string) "PostgreSQL",  
    "1": (string) "triathlon"  
  }  
}
```

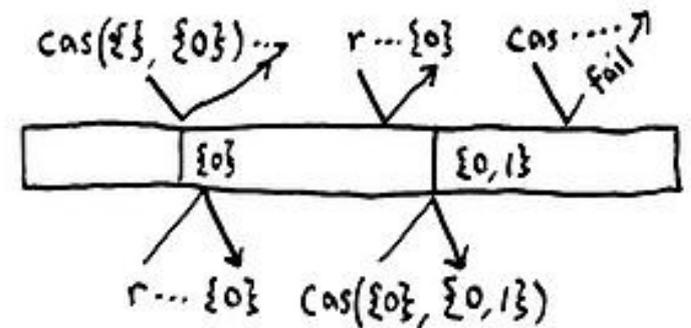

metadata → Isn't that... **schema**?

The schema-less fallacy

- It's not schema-less
- It is “*attached-schema*”
- It carries an overhead which is not 0

High availability: at what cost?

Jepsen!!! :)

$\text{cas}, \text{cas}, \text{cas}, \text{cas}, \dots$ read final
 $+0 \quad +1 \quad +2 \quad +3 \quad \uparrow \quad \{0, 1, 2, 3, \dots\}$
?

MongoDB:

- Unacknowledged: 42% data loss
- Safe: 37% data loss
- Only majority is safe

<http://aphyr.com/posts/284-call-me-maybe-mongodb>

More NoSQL struggle

- Durability is sometimes not guaranteed on a single node
- Programming for AP systems may be a big burden
- Most (all?) NoSQL databases wrote their storage from scratch. **Journaling, concurrency are really hard**

Can we do a better “NoSQL”?

- Document model is very appealing to many. Let's offer it
- **DRY: why not use relational databases?** They are proven, durable, concurrent and flexible
- Why not base it on relational databases, like PostgreSQL?

Schema-attached repetition

{ "a": 1, "b": 2 }

{ "a": 3 }

{ "a": 4, "c": 5 }

{ "a": 6, "b": 7 }

{ "b": 8 }

{ "a": 9, "b": 10 }

{ "a": 11, "b": 12, "i": 13 }

{ "a": 14, "c": 15 }

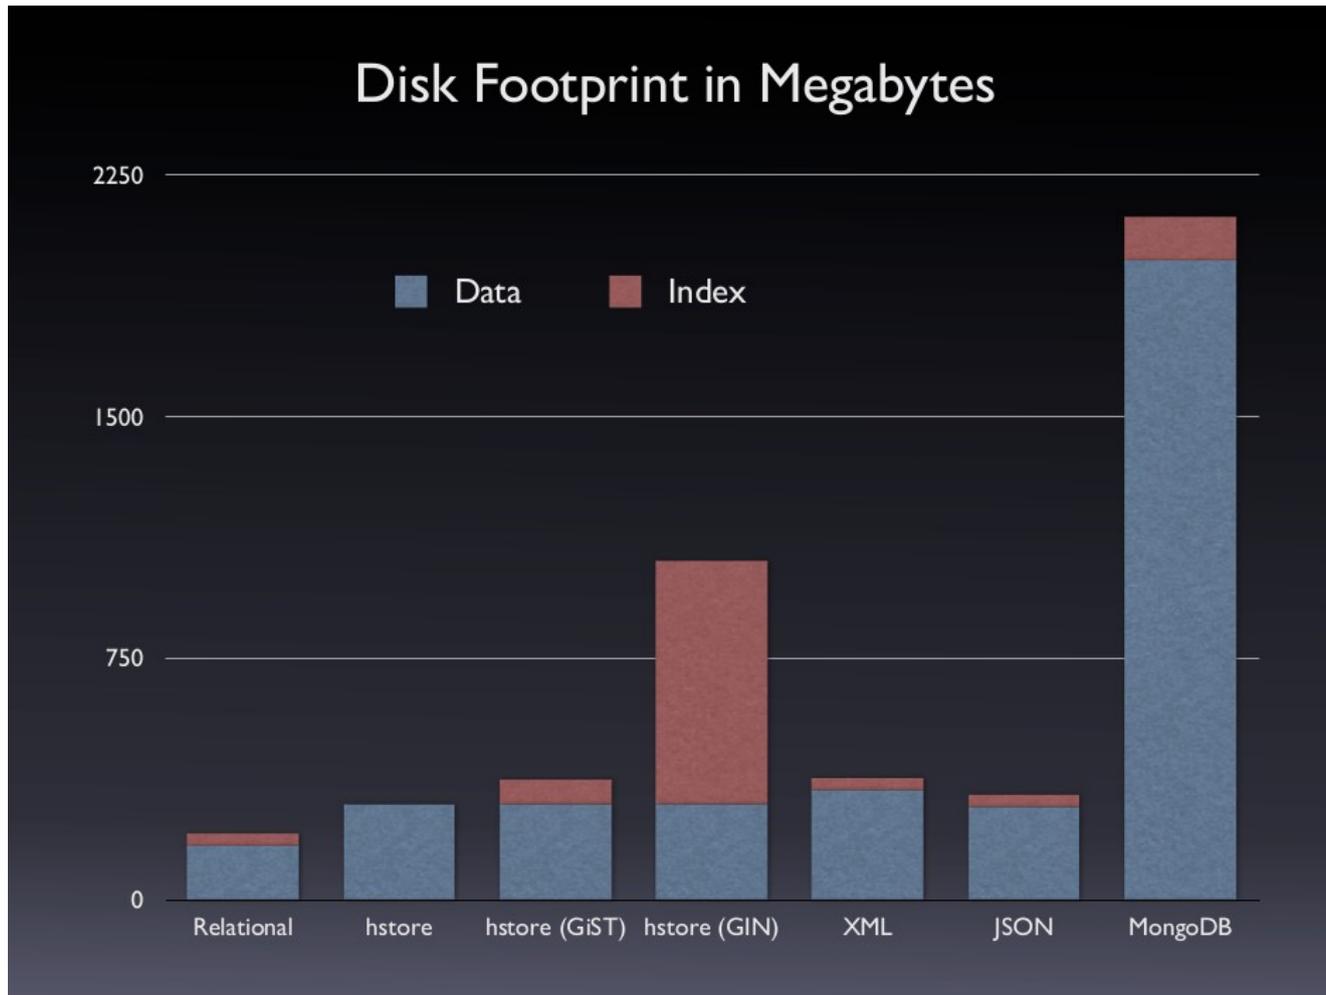

Counting
"document
types" in
collections
of millions:
at most,
1000s of
different
types

Schema-attached repetition

How data is stored in schema-less

Pettus and BTP inspired us

<https://wiki.postgresql.org/images/b/b4/Pg-as-nosql-pgday-fosdem-2013.pdf>
<http://www.slideshare.net/nosys/billion-tables-project-nycpug-2013>

ToroDB

What is ToroDB

- Open source, document-oriented, JSON database that runs on top of PostgreSQL
- JSON documents are stored relationally, not as a blob: significant storage and I/O savings
- Wire-protocol compatibility with Mongo

ToroDB benefits

- 100% durable database
- High concurrency and performance
- Compatible with existing mongo API programs, clients
- Full set of JSON operations (MongoDB's "SELECT" API)

ToroDB storage

- Data is stored in tables
- JSON documents are split by hierarchy levels, and each (plain) level goes to a different table
- Subdocuments are classified by “type”, which maps to tables

ToroDB storage (II)

- A “structure” table keeps the subdocument “schema”
- Keys in JSON are mapped to attributes, which retain the original name
- Tables are created dynamically and transparently to match the exact types of the documents

ToroDB storage (III)

How data is stored in ToroDB

ToroDB storage internals

```
{  
  "name": "ToroDB",  
  "data": {  
    "a": 42, "b": "hello world!"  
  },  
  "nested": {  
    "i": 42,  
    "deeper": {  
      "a": 21, "b": "hello"  
    }  
  }  
}
```

ToroDB storage internals

The document is split into the following subdocuments:

```
{ "name": "ToroDB", "data": {}, "nested": {} }
```

```
{ "a": 42, "b": "hello world!" }
```

```
{ "i": 42, "deeper": {} }
```

```
{ "a": 21, "b": "hello" }
```

ToroDB storage internals

```
select * from demo.t_3
```

did	index	_id	name
0	0	\x5451a07de7032d23a908576d	ToroDB

```
select * from demo.t_1
```

did	index	a	b
0	0	42	hello world!
0	1	21	hello

```
select * from demo.t_2
```

did	index	j
0	0	42

ToroDB storage internals

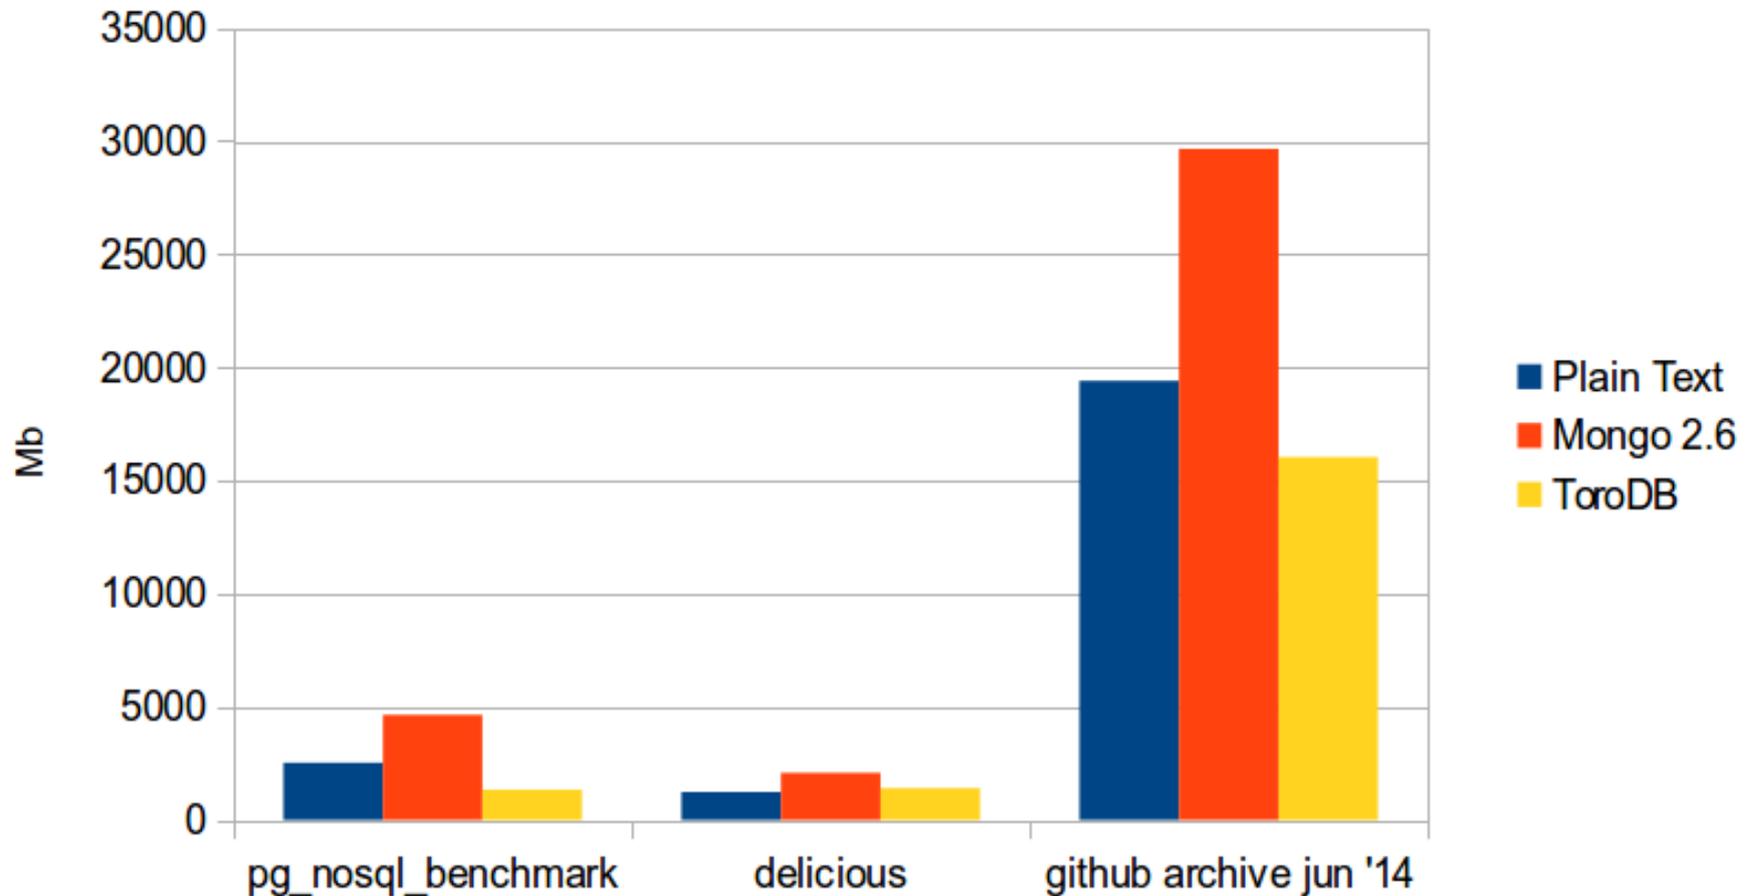

```
select * from demo.structures
```

sid	_structure
0	{"t": 2, "data": {"t": 1}, "nested": {"t": 3, "deeper": {"i": 1, "t": 1}}}

```
select * from demo.root;
```

did	sid
0	0

ToroDB storage and I/O savings

29% - 68% storage required,
compared to Mongo 2.6

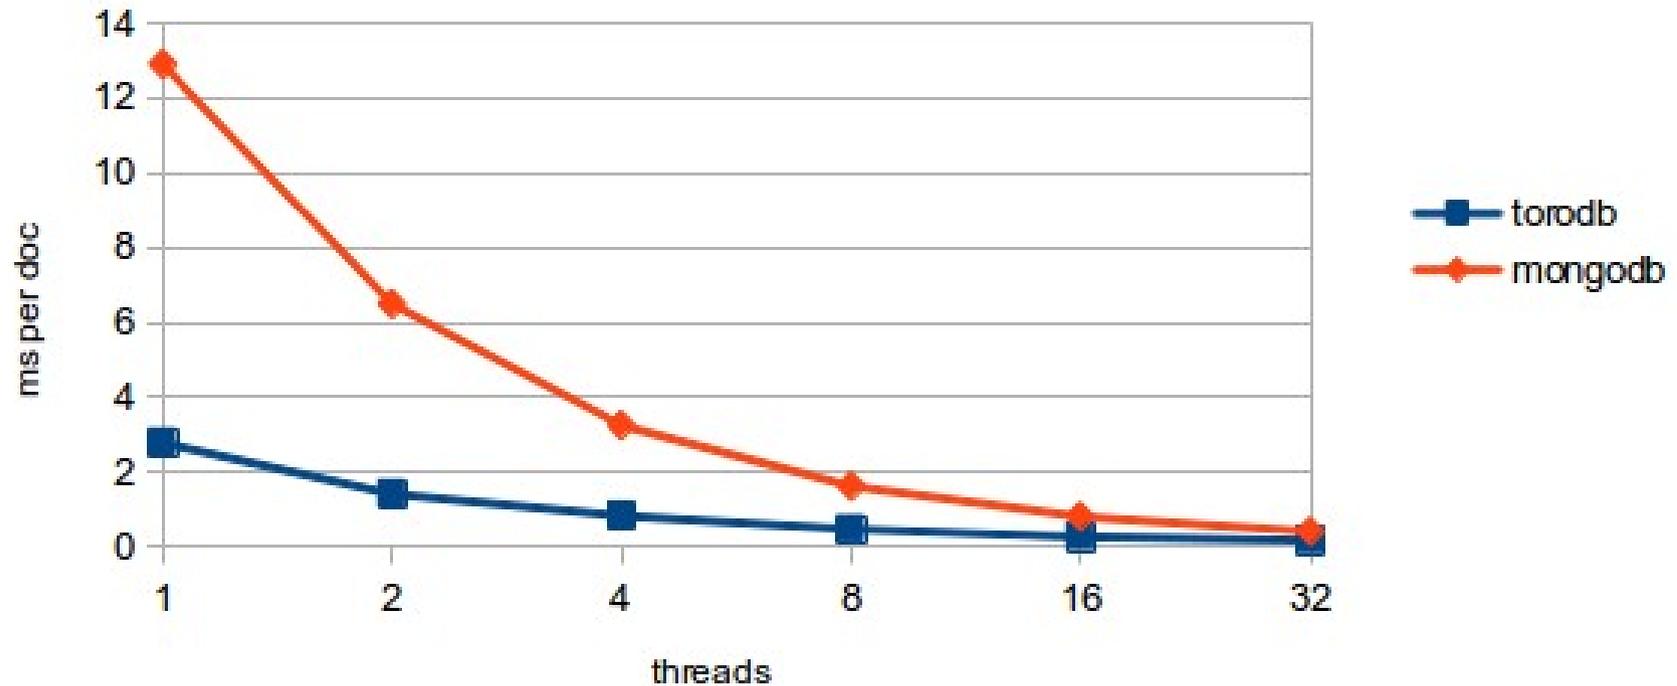

ToroDB performance

ToroDB performance (II)

customer_reviews

batch 1

ToroDB: query “by structure”

- ToroDB is effectively **partitioning by type**
- Structures (schemas, partitioning types) are cached in ToroDB memory
- Queries only scan a subset of the data.
- Negative queries are served directly from memory.

ToroDB: Developer Preview

- ToroDB launched on October 2014, as a Developer Preview. Support for CRUD and most of the SELECT API
- github.com/torodb
- RERO policy. Comments, feedback, patches... greatly appreciated
- AGPLv3

ToroDB: Developer Preview

- Clone the repo, build with Maven
- Or download the JAR:
<http://maven.torodb.com/jar/com/torodb/torodb/0.15/torodb.jar>
- Usage:

```
java -jar torodb-version.jar --help  
java -jar torodb/target/torodb-version.jar -d dbname -u  
dbuser -P 27017
```

Connect with normal mongo console!

As nice as SQL storage engines are these days, projects like ToroDB speak to a real problem: SQL is a fucking terrible API.

Loving the look of github.com/torodb/torodb - speaks Mongo protocol with a Postgres relational backend. Best of both? [#nosql](https://twitter.com/nosql)

ToroDB: Roadmap

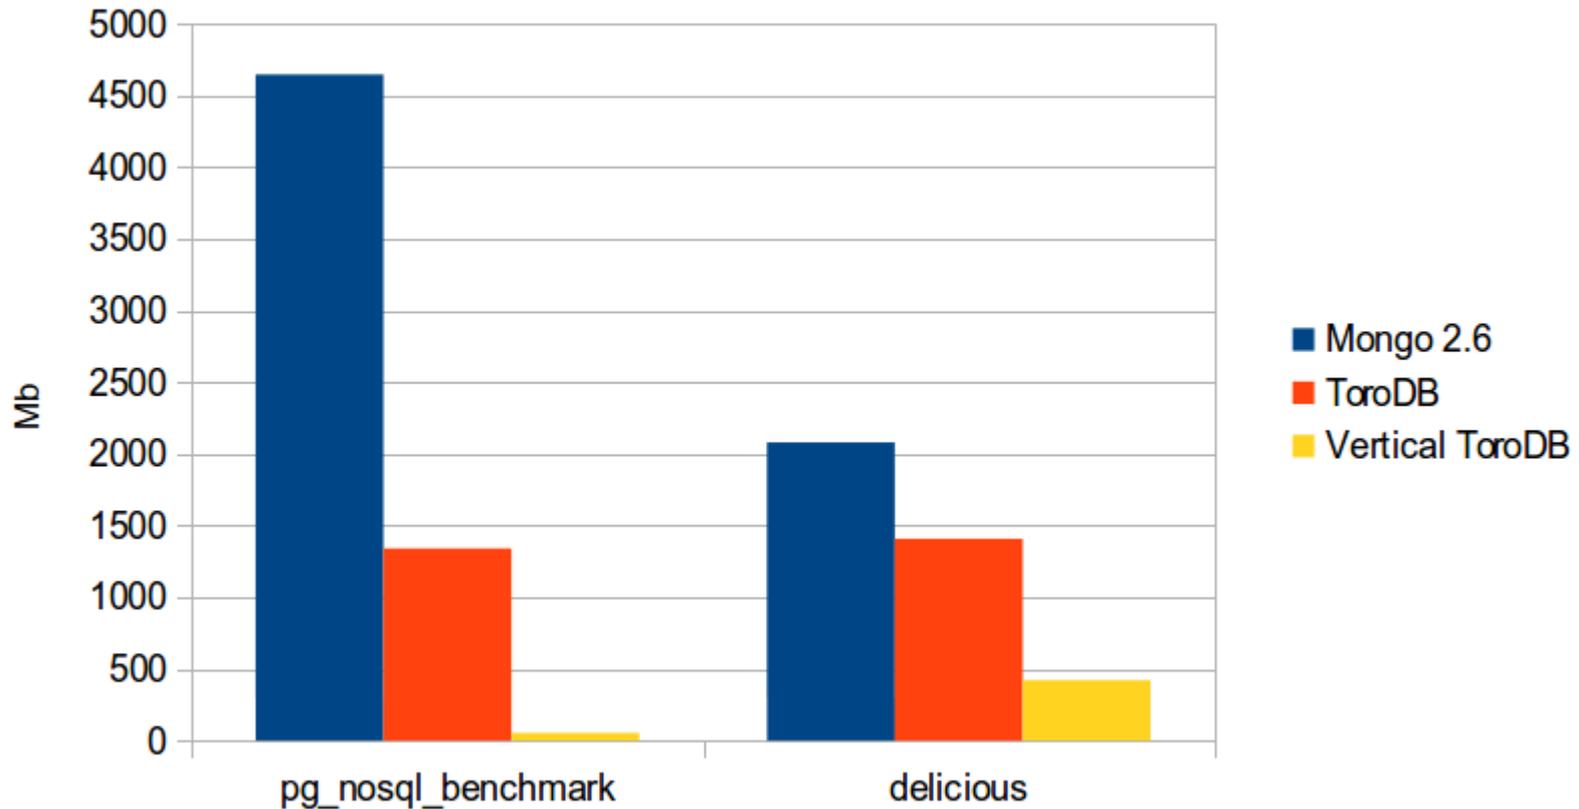

- Current Developer Preview is single-node
- Version 1.0:
 - Expected Q1 2015
 - Production-ready
 - MongoDB Replication support (Paxos-based replication protocol?)
 - Very high compatibility with Mongo API

Big Data speaking mongo: Vertical ToroDB

What if we use CitusData's cstore to store the JSON documents?

Big Data speaking mongo: Vertical ToroDB

1.17% - 20.26% storage required,
compared to Mongo 2.6

“Software acknowledgements”

- PostgreSQL!
- The Netty framework
- jOOQ
- Guava, guice, findbugs
- Hikari CP
